                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                FUNCTION: This protein is essential to the cell-division process. It seems to assemble into a dynamic ring on the inner surface of the cytoplasmic membrane at the place where division will occur, and the formation of the ring is the signal for septation to begin. Binds to and hydrolyzes GTP (By similarity). SUBUNIT: Aggregates to form a ring-like structure (By similarity). SUBCELIULAR LOCATION: Cytoplasmic. Assembles at the inner surface of the cytoplasmic membrane (By similarity). SIMILARITY: BELONGS TO THE FTSZ FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      121 KELAKYYDTLIVVPNQNLLALADKSTTMLEAFRYADDVLLEGVKGYTDLIVRPGLINL

Nucleic Acids Res. 28:4317-4331(2000).

-!- FUNCTION: This protein is essential to the cell-division process.

It seems to assemble into a dynamic ring on the inner surface of the cytoplasmic membrane at the place where division will occur, and the formation of the ring is the signal for septation to begin. Binds to and hydrolyzes GTP (By similarity).

-!- SUBCILIULAR LOCATION: Cytoplasmic. Assembles at the inner surface of the circular access of the cir
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TIGRFAMS; TIGR00065; ftsZ; 1

Genet. 240:213-220(1993).

FUNCTION: This protein is essential to the cell-division process. It seems to assemble into a dynamic ring on the inner surface of the cytoplasmic membrane at the place where division will occur, and the formation of the ring is the signal for septation to begin. Binds to and hydrolyzes GTP (By similarity).

SUBUNIT: Aggregates to form a ring-like structure (By similarity). SUBCELLULAR LOCATION: Cytoplasmic. Assembles at the inner surface of the cytoplasmic membrane (By similarity).

SIMILARITY: BELONGS TO THE FTSZ FAMILY.

                                                                                                                                                                                                  Submitted (JUN-1992) to the EMBL/GenBank/DDBJ databases.

- I FUNCTION: This protein is essential to the cell-division process.

- It seems to assemble into a dynamic ring on the inner surface of the cytoplasmic membrane at the place where division will occur, and the formation of the ring is the signal for septation to begin. Binds to and hydrolyzes GTP (By similarity).

- I SUBUNIT: Aggregates to form a ring-like structure (By similarity).

- I SUBCELLULAR LOCATION: Cytoplasmic. Assembles at the inner surface
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Fraser C.M., Casjens S., Huang W.M., Sutton G.G., Clayton R.A., Lathigra R., White O., Ketchum K.A., Dodson R., Hickey E.K., Gwinn Dougherty B., Tomb J.-F., Fleischmann R.D., Richardson D., Peterson J., Kerlavage A.R., Quackenbush J., Salzberg S., Hanson M. van Vugt R., Palmer N., Adams M.D., Gocayne J.D., Weidman J., Utterback T., Watthey L., McDonald L., Artiach P., Bowman C., Garland S., Fujii C., Cotton M.D., Horst K., Roberts K., Hatch B., "Genomic sequence of a Lyme disease spirochaete, Borrelia burgdorferi.";

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           FUNCTION: This protein is essential to the cell-division process. It seems to assemble into a dynamic ring on the inner surface of the cytoplasmic membrane at the place where division will occur, and the formation of the ring is the signal for septation to begin. Blnds to and hydrolyzes GTP (By similarity). SUBCHILLIAR LOCATION: Cytoplasmic. Assembles at the inner surface of the cytoplasmic membrane (By similarity). SIMCELLULAR LOCATION: CYTOPLASMIC. Assembles at the inner surface of the cytoplasmic membrane (By similarity).

"Cloning, genetic organization, and characterization of a structural
gene encoding bacillopeptidase F from Bacillus subtilis.";

J. Biol. Chem. 265:6845-6850(1990).

-I- FUNCTION: This protein is essential to the cell-division process.

It seems to assemble into a dynamic ring on the inner surface of
the cytoplasmic membrane at the place where division will occur,
and the formation of the ring is the signal for septation to
begin. Binds to and hydrolyzes GTP (By similarity).

-I- SUBURIT: Aggregates to form a ring-like structure (By similarity).

-I- SUBCELLULAR LOCATION: Cytoplasmic Assembles at the inner surface
of the cytoplasmic membrane (By similarity).

-I- SIMILARITY: BELONGS TO THE FTSZ FAMILY.
                                                                                                                             Pfam; PF00091; tubulin; 1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 mitted (APR-1998) to the EMBL/GenBank/DDBJ databases. FUNCTION: This protein is essential to the cell-division process. It seems to assemble into a dynamic ring on the inner surface of the cytoplasmic membrane at the place where division will occur, and the formation of the ring is the signal for septation to begin. Binds to and hydrolyzes GTP (By similarity). SUBCELLULAR LOCATION: Cytoplasmic. Assembles at the inner surface of the cytoplasmic membrane (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            of the cytoplasmic membrane (By similarity). Binds to and hydrolyzes GTP (By similarity).

-! SUBUNIT: Aggregates to form a ring-like structure (By similarity).

-!- SUBCELLULAR LOCATION: Cytoplasmic. Assembles at the inner surface of the cytoplasmic membrane (By similarity).

-!- SIMILARITY: BELONGS TO THE FTSZ FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        008439;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           FUNCTION: This protein is essential to the cell-division process. It seems to assemble into a dynamic ring on the inner surface of the cytoplasmic membrane at the place where division will occur, and the formation of the ring is the signal for septation to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           156 KENVDTLLIISNNRLLEVVDKKTPMLEAFREADNVLRQGVQGISDLITAPGYVNL 210

                                                                                                                                                                                                                                                                                                                                                                                                                                                                           begin. Binds to and hydrolyzes GTP (By similarity).
SUBUNIT: Aggregates to form a ring-like structure (By similarity).
SUBCELLULAR LOCATION: Cytoplasmic. Assembles at the inner surface of the cytoplasmic membrane (By similarity).
SIMILARITY: BELONGS TO THE FTSZ FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  FUNCTION: This protein is essential to the cell-division process. It seems to assemble into a dynamic ring on the inner surface of the cytoplasmic membrane at the place where division will occur, and the formation of the ring is the signal for septation to
                                                                                                                                                                                                                                                              division; Septation; GTP-binding.

"Complete genome sequence of the model actinomycete Streptomyces coelicolor A3(2).";
Nature 417:141-147(2002).

11 seems to assemble into a dynamic ring on the inner surface of the cytoplasmic membrane at the place where division will occur, and the formation of the ring is the signal for septation to begin. Binds to and hydrolyzes GTP (By similarity).

12 SUBCELLULAR LOCATION: Cytoplasmic hasembles at the inner surface of the cytoplasmic membrane (By similarity).

13 SUBCELLULAR COCATION: Cytoplasmic, Assembles at the inner surface of the cytoplasmic membrane (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This SWISS-PROT entry is copyright. Submitted (APR-2001) to the EMBL/GenBank/DBJ databases.
-!- FUNCTION: This protein is essential to the cell-division process.
-!- EUNCTION: This protein is essential to the cell-division process.
-!- EUNCTION: This protein is essential to the cell-division process.
-!- It seems to assemble into a dynamic ring on the inner surface of the cytoplasmic membrane at the place where division will occur, and the formation of the ring is the signal for septation to egin. Binds to and hydrolyzes GTP (By similarity).
-!- SUBCHLULAR LOCATION: Cytoplasmic. Assembles at the inner surface of the cytoplasmic membrane (By similarity).
-!- SUBCELLULAR LOCATION: Cytoplasmic. Assembles at the inner surface.
-!- SIMILARITY: BELONGS TO THE FTSZ FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Fleischmann R.D., Alland D., Eisen J.A., Carpenter L:, White.O., Peterson J., DeBoy R., Dodson R., Gwinn M.L., Haft D., Hickey E., Kolonay J.F., Nelson W.C., Umayam L.A., Ermolaeva M.D., Salzberg S.L., Delcher A., Utterback T., Weidman J., Khouri H., Gill J., Mikula A.,

                                                                                                                                                                                                                                                                                         FUNCTION: This protein is essential to the cell-division process. It seems to assemble into a dynamic ring on the inner surface of the cytoplasmic membrane at the place where division will occur, and the formation of the ring is the signal for septation to begin. Binds to and hydrolyzes GTP (By similarity). SUBUNIT: Aggregates to form a ring-like structure (By similarity). SUBCLLULAR LOCATION: Cytoplasmic. Assembles at the inner surface
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  STRGR

"Characterization of the ftsz gene in Ehrlichia chaffeensis, the HGE

"Characterization of the ftsz gene in Ehrlichia chaffeensis, the HGE

agent and Rickettsia rickettsii.";

Submitted (JAN-2000) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: THIS PROTEIN IS ESSENTIAL TO THE CELL-DIVISION PROCESS.

-!- FUNCTION: THIS PROTEIN IS ESSENTIAL TO THE INTER SUBFACE OF

THE CYTOPLASMIC MEMBRANE AT THE PLACE WHERE DIVISION WILL OCCUR,

AND THE FORMATION OF THE RING IS THE SIGNAL FOR SEPFATION TO

BEGIN. BINDS TO AND HYDROLYZES GTP (BY SIMILARITY).
 EMBL;
             -i- SUBUNIT: AGGREGATE TO FORM A RING-LIKE STRUCTURE (BY SIMILARITY)
-i- SUBCELLULAR LOCATION: CYTOPLASMIC. ASSEMBLE AT THE INNER SURFACE
OF THE CYTOPLASMIC MEMBRANE (BY SIMILARITY).
-i- SIMILARITY: BELONGS TO THE FTSZ FAMILY.

-I- FUNCTION: THIS PROTEIN IS ESSENTIAL TO THE CELL-DIVISION PROCESS.

ITS SEEMS TO ASSEMBLE INTO A DYNAMIC RING ON THE INNER SURFACE OF THE CYTOPLASMIC MEMBRANE AT THE PLACE WHERE DIVISION WILL OCCUR, AND THE FORMATION OF THE RING IS THE SIGNAL FOR SEPTATION TO BEGIN. BINDS TO AND HYDROLYZES GTP (BY SIMILARITY).

-I- SUBUNIT: AGGREGATE TO FORM A RING-LIKE STRUCTURE (BY SIMILARITY).

-I- SUBCELLULAR LOCATION: CYTOPLASMIC. ASSEMBLE AT THE INNER SURFACE OF THE CYTOPLASMIC MEMBRANE (BY SIMILARITY).

Molecular identification of a Wolbachia endosymbiont in a Tetranychus
urticae strain (Acari: Tetranychidae).;
Insect Mol. Biol. 5:217-221(1996).

-i- FUNCTION: THIS PROTEIN IS ESSENTIAL TO THE CELL-DIVISION PROCESS.
ITS SEEMS TO ASSEMBLE INTO A DYNAMIC RING ON THE INNER SURFACE OF
THE CYTOPLASMIC MEMBRANE AT THE PLACE WHERE DYVISION WILL OCCUR,
AND THE FORMATION OF THE RING IS THE SIGNAL FOR SEPTATION TO
BEGIN. BINDS TO AND HYDROLYZES GTP (BY SIMILARITY).

Russ. Entomol. J. 7:163-168(1998).

-I- FUNCTION: THIS PROTEIN IS ESSENTIAL TO THE CELL-DIVISION PROCESS.
-I- SEEMS TO ASSEMBLE INTO A DYNAMIC RING ON THE INNER SUFFACE OF THE CYTOPLASMIC MEMBRANE AT THE PLACE WHERE DIVISION WILL OCCUR, AND THE FORMATION OF THE RING IS THE SIGNAL FOR SEPTATION TO BEGIN. BINDS TO AND HYDROLYZES GTP (BY SIMILARITY).
-I- SUBCELLULAR LOCATION: CYTOPLASMIC. ASSEMBLE AT THE INNER SURFACE OF THE CYTOPLASMIC MEMBRANE (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               NON_TER
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      01-JUL-1997 (TrEMBLrel. 04, Created)

RI Submitted (MAY-1997) to the EMBL/GenBank/DDBJ databases.

CC -!- FUNCTION: THIS PROTEIN IS ESSENTIAL TO THE CELL-DIVISION PROCESS.

CC ITS SEEMS TO ASSEMBLE INTO A DYNAMIC RING ON THE INNER SURFACE OF THE CYTOPLASMIC MEMBRANE AT THE PLACE WHERE DIVISION WILL OCCUR,

CC AND THE FORMATION OF THE RING IS THE SIGNAL FOR SEPTATION TO

CC BEGIN. BINDS TO AND HYDROLYZES GTP (BY SIMILARITY).

CC -!- SUBUNIT: AGGRECATE TO FORM A RING-LIKE STRUCTURE (BY SIMILARITY).

CC -!- SUBCELLULAR LOCATION: CYTOPLASMIC ASSEMBLE AT THE INNER SURFACE.

CC OF THE CYTOPLASMIC MEMBRANE (BY SIMILARITY).

                                                                                                                                                                                                                                                                                                                               It seems to assemble into a dynamic ring on the inner surface of the cytoplasmic membrane at the place where division will occur, and the formation of the ring is the signal for septation to begin. Binds to and hydrolyzes GTP (By similarity).

1. SUBCELLULAR LOCATION: Cytoplasmic. Assembles at the inner surface of the cytoplasmic membrane (By similarity).

2. SIMILARITY: BELONGS TO THE FTSZ FAMILY.
